

Shopping Cart like experience for Engaging Networks

Donation pages

This package turns an Engaging Networks donation page into a shopping-cart-style experience. Supporters can add "items" to their cart, adjust quantities, choose one-time or monthly giving, and enter a custom amount before submitting a single donation.

How to use it

The Shopping Cart page will try to use the currency code from the `transaction.paycurrency` hidden field. You can override or control the currency symbol by adding one of these classes to a card or the Other Amount block: `usd` , `dollar` , `eur` , `euro` , `gbp` , `pound` , `cad` , `canadian` , `aud` , `australian` .

You can set the currency code position to the right of the amount by adding the `currency-right` class to either the card's row (global) or the card's container (specific).

Creating the Header

Add an advanced row with the class `sc-header` . The row should contain:

1. A **Copy Block** with:
 - An optional small label paragraph.
 - An `h1` headline.
 - A short body paragraph.
2. An **Image Block** with the header image.

The text content is positioned on the left and the image fills the right column.

Available themes

Apply a theme by adding one of these classes to a card, the header, or an information component:

- **bg-navy**: `#163F58` — white text, navy amount circle
- **bg-red**: `#E22028` — white text, navy amount circle
- **bg-gradient**: linear gradient from `#163F58` to `#E22028` — white text

Creating a Card

Each card is a Copy Block inside an advanced row with the class `sc-cards` . Build a card with this structure:

1. First paragraph: the card image (optional).
2. A heading (`h1` , `h2` , or `h3`) with the card title.
3. The next paragraph must contain the card amount (for example, `25`). The script reads this value automatically.
4. Add any theme class such as `bg-navy` or `bg-red` to the Copy Block.

The script injects the quantity controls and the circular amount badge for each card.

Adding the Other Amount Block & Theming Cards

To let supporters enter a custom amount:

1. Add a Copy Block inside `sc-cards` with the class `block-other`.
2. Add a heading and an optional image. The custom amount input is generated automatically.
3. Apply a theme class to match the surrounding cards.

Creating the Information Row

Add an advanced row with the class `sc-info`. The row typically contains:

1. An optional **Image Block** for an icon or photo.
2. A **Copy Block** with an `info-title` class and a heading.
3. A **Checkbox** inside a Copy Block with the class `monthly-checkbox` to let supporters toggle monthly giving.

Live Variables `TOTAL` & `FREQUENCY`

You can reference the running cart total and the selected frequency anywhere in a Copy Block, Code Block, or button label by using:

- `[[TOTAL]]` — the current sum of selected card quantities and the other amount.
- `[[FREQUENCY]]` — the selected frequency label when monthly giving is active (empty for one-time).

The script replaces these placeholders live as the supporter makes selections.

Using the flip image

To show a second image when a card is selected, place two images in the first paragraph of the card. When the card's quantity is greater than zero, the card flips to reveal the second image.

Debugging

If you need to troubleshoot your page, add `?debug=true` to your URL. This will enable verbose `console.log` outputs from the script and visually highlight hidden form fields (like the generated `transaction.comments` text area) in light red.

Development

- Clone the repository
- Run `npm install`
- Make changes to the `src` folder
- Run `npm run build` to compile the changes
- Deploy the content of the `dist` folder to Engaging Networks

NB: On windows you may also need to install the `node_env` npm package:

```
npm install -g win-node-env
```
